**ABSTRACT** This study conducted a rigorous descriptive-analytical investigation of divorce factors in Hail City, Saudi Arabia in the latter half of the year 2023. An extensive survey of 88 divorced adults aged 18 and over was administered to gather data on social, behavioural, psychological and economic aspects. The questionnaire's reliability and validity were rigorously scrutinised to ensure the trustworthiness of the data. Findings presented in descending order of significance revealed that behavioural factors had the greatest influence on divorce followed closely by psychological and economic factors. Societal factors such as educational disparities and family interference also emerged as significant contributors to divorce. Additionally, a quantitative analysis of demographic determinants revealed nuanced variations based on gender educational attainment, the wife's employment status and partner selection method. These insights are vital for policymakers and individuals seeking to address and mitigate divorce-related challenges in the region.
