**KEY WORDS** Anesthetization. Post-modern Capitalism. Nostalgia. Risk. Alienation. Otherness. Cosmopolitanism. Ethics

**ABSTRACT** Technology has proved itself not to be the panacea for all human needs and passions. Recent information technology extends the horizons of the real to the imagerial. However, this extension is realized by the means of non-creation of material product but of information. Simulation of these information for the benefits of interested groups or companies as well as fragmentation of any possible rational meaning create a chaos in the heads of people informed. We live in an acceleration of global risks for the benefit of invisible minoritarian groups of interests. The public role of the state cannot compete private interests and alienation of targets. Goals and aims is the final possible for crowds, professional groups and educated individuals entered in the game of post-modernization, consumption of every possible innovation and fashionable lifestyle. Financial inequality resulting to unequal chances starting from the very early education and going up to the professional orientation of youth, creates difference in the "globalization effect" for all. A cosmopolitan model such as was developed in various cultural settings, is proposed as the only alternative of escape from the massive misery of typified and stereotyped social behaviors and related attitude. This model presupposes the knowledge and conscience of the so called *c' & R*" (measure) and its resulting ethics. Also to the promotion of "another" non-specialized but humanitarian education aiming not to the maximalisation of "useful" knowledge but rather to the alternative teaching and learning of "thinking how and why to think."
