KEYWORDS Students. Personal Justice. Decision Making Perception. Sport Sciences

ABSTRACT The present study aimed to reveal whether personal justice perceptions of the students at the faculty of sport science have impact on their decision making process. Based on the correlation table, it was observed that there is weak and positive relationship between their personal 'fair world perceptions' and dilatory decision making process. In the study, it was found that there is a significant relationship between students' personal perception concerning belief in a just world and their self confidence levels in decision making and dilatory decision making process. Hence, it could be concluded that as students' personal fair world perception increases, their dilatory decision making process develops in quite limited amount.
