KEYWORDS Transmission. *Amsams* (*Units of Inheritance*). Genes. Generations. Association

ABSTRACT The article in the Tamil magazine *Subayogam* has stated that a man has 84 '*amsams*' in his reproductive age. It includes 28 of his own and 56 passed on from his paternal line forefathers of 6 generations. The present paper has interpreted that the same 84 *amsams* could be present in the gametes of the women and the offsprings receive the *amsams* from the grandmothers of the paternal line as well as from the grandparents of the maternal line. The paper has also attempted the association between the *amsams* and the reported genes in human. The 28 *amsams* specific to the gametes could be more or less equal to the non-identical 30 genes calculated as 0.1 percent from the reported 30,000 genes. From the *amsams* or the genes, it is seen, that the genetic constitution of the cloned cells could be different from that of their parent.
